

How CETEM saves time and improves sustainability with CES Selector

CETEM is a technological center working in the furniture and wood industry in Spain. Typical customers are furniture and wood-processing companies, but the center also works with those specializing in plastics, metals, and composites.

Using CES Selector, CETEM has an important technical support tool as it solves research and innovation projects. The software has helped the center to define compositions of products, and look for different commercial options – for example, working with several suppliers. In addition, CES Selector has helped with the comparison of different materials, and enabled CETEM to find similar options which were previously unknown.

The center described how CES Selector has aided innovation as they use it to search for new materials with suitable properties to use in new products. Furthermore, materials are compared according to their properties, ensuring the most suitable material can be selected for each innovative application.

In terms of sustainability, the use of the Eco Audit Tool for analyzing the environmental impact of different products is making daily work easier.

As a result, the center has seen time savings of 25 to 40%, depending on each case. The number of activities at CETEM undertaken with CES Selector continues to increase.
